

Media release

March 2016

infiniDent expands available shades for the high-tech nanocomposite Ambarino® High-Class.

Darmstadt, March 3, 2016. infinidDent, the open digital service provider for dental laboratories now offers extended shade options for its high-tech nanocomposite Ambarino® High-Class. In addition to the shades A1, A2, A3 there will also shades B1, C2 and D2 available.

AMBARINO® High-Class, the alternative to full and veneer ceramics, is characterized by its exceptional stability, reduced abrasion properties and excellent wearing properties.

The material is suitable for producing partial crowns, single crowns and bridge frameworks in the anterior and posterior regions with a maximum of one pontic.

AMBARINO® High-Class can be produced in both anatomically reduced and full anatomical versions and is suitable for temporary and permanent dental restorations.

Benefits of the material

- High-tech nanocomposite for outstanding stability and esthetics
- Metal-free material, ideal for patients with metal allergies
- No chipping of the veneer materials thanks to the nanoscale structure
- Very high abrasion resistance (very close to that of natural tooth enamel)
- AMBARINO® High-Class can also be repaired in situ
- Thanks to its dentine-like elasticity, the material absorbs shocks and masticatory forces and minimizes the risk of a bone fracture, as such is very well suited for implants

All new shades are available immediately. Further information can be obtained from www.infinidentservices.com.

Pictorial material

The following information and current pictures are available free of charge in different sizes and in a printable resolution.
